

Blueprint of the cinema OS

One picture of why the app exists, what each room does, and how a film moves from a two-line brief or PDF to Matrix shots, cast, world, compile, and generate — without mixing projects.

WHY IT EXISTS

Stage Work Studio (StageWorks) is a director's table, not a chatbot. Cloud owns account, license, device, and paid APIs. The computer stays the user's — the studio never deletes their files. Owner **pedditiram@gmail.com** is always Enterprise.

Positioning: cinema craft intelligence for the modern slate — script → 26-craft shot matrix → locked looks → still/video takes. Local Vite: <http://127.0.0.1:5173>.

1. Mind map — the whole studio

CENTRE

Active project

One title at a time · own shots, Writer, Cast, World, room

ACCESS

- Login / device / heartbeat
- Plans trial → Enterprise
- Allotted projects for team
- BYOK keys vs studio credits

PROJECT CONSOLE

- Library, new, archive
- Parse PDF / two-line brief
- Apply shots to this title only
- Director / DoP / Sound vaults

STORY ROOMS

- Writer — pages + synopsis
- Matrix — shot grid
- Form — one-shot craft desk
- Character — profiles + ref sheets
- World — locations / plates

PICTURE ROOMS

- Compile — cinema prompts
- Generate — still | video take
- Storyboard / Reel
- 3D Stage (optional)
- Promo / Campaign / Pitch / Budget

2. Production spine (how work actually moves)

1. OPEN FILM

Correct title in Project Console (e.g. MVK, not another card).

2. INGEST

Two-line brief or PDF. Parse expands coverage + dialogue on shots.

3. APPLY

Writes Matrix for that title only. Parks Writer / Cast extras on the project.

4. BIBLES

Extract people from Matrix. Ref sheets = prompts from their shots. World plates.

5. FLAVOUR

Director / DoP / Sound after parse. Mood (Director frequency) enters Compile.

6. PICTURE

Compile prompt → Generate still → last frame → video. Reel lists clips.

Parse does not read Director/DoP boxes. Compile/Generate read Matrix crafts + a short Director mood line.

3. Room brief

Room	Exists to	Main functions
Project Console	Keep films separate and ingest story	Library, parse, Apply, Director/DoP/Sound, genre, allotments
Writer	Hold the living screenplay	Pages, synopsis, Telugu/English dictate, feeds extract
Matrix / Form	Be the shot authority	26-craft rows; Form edits one shot; continuity last-frame bind
Character	Lock people, not stock warriors	Extract profiles; copy profile; ref sheets from that person's shots; lock face/body stills
World	Lock place	Locations, plates, props used in compile
Compile	Speak to image/video models	Per-shot master cinema prompt + refs
Generate	Take desk (not a node graph)	Still I Video; poll Seedance; save clip on the shot
Storyboard / Reel / Promo	Show the cut and sell it	Boards, feature reel, campaign / pitch / budget
Settings / SaaS	Keys, credits, team	Gemini, BytePlus, BYOK, Stripe packs, console flags

4. What stays on the film vs what is global

PER PROJECT (MUST NOT LEAK)

Title, shots, Writer text, Cast, World, Director/DoP/Sound, genre, generate clips, own collab room (sps_mvsk style — not one shared room for every film).

ACCOUNT / STUDIO

Login, plan, device, API keys, credit ledger, which consoles a user may open. Keys are not sent to the backend in BYOK mode.

5. Cloud vs local

LOCAL OS

Edit Matrix, Writer, Cast. Disk vault + browser cache. Never remote-wipe the machine.

CLOUD AUTHORITY

License, session, managed generate (/api/generate-image, /api/generate-video), library sync.

TEAM

Owner creates films. Editors work allotted titles. One invite ? room= per film.

6. Production habits (so work is not lost)

- Parse and **Apply only while the correct title is active.**
- After a large parse, check header title + shot count, then reload once.
- Do not use “Clear local cache” unless the app will not start — that wipes local drafts.
- Director/DoP flavour: fill *after* Apply; set Human / AI / Hybrid **USE** before Compile.
